

Towards Understanding the Lead Blast Furnace – Contents

Overview	1
1. Introduction	7
2. Carbothermic Reduction of Metal Oxides	8
3. Lead Blast Furnace Smelting	11
4. Port Pirie Developments	13
5. The Lumsden Concept of Lead Blast Furnace Chemistry	16
6. Reconciling Lumsden's Hypotheses with Practice	20
Slagging zone equilibrium	22
An influence of kinetics?	27
Reduction in the furnace shaft	32
Top reaction zone	35
7. The Problem of Bridging in the Lead Blast Furnace	39
8. The Kinetics of Reduction of Lead Sinters	46
Sinter mineralogy and reduction kinetics	55
The zonal reduction profile of the lead blast furnace	62
9. Sulfur Deportment in the Lead Blast Furnace	64
Thermochemistry of sulfur deportment in the hearth zone	65
Sinter plant practice and the control of the sulfur content of sinter	70
Eliminating sulfur from the blast furnace as SO ₂	74
10. Implications for Process Modelling	79
Blast rate and productivity prediction	81
Defining reaction outcomes in the furnace shaft	83
<i>Melting rate control</i>	85
<i>Chemical reaction rate control</i>	86

Changing phase compositions and reduction kinetics	89
<i>The interfacial surface, S</i>	90
<i>Gas phase composition, CO concentration and liquid-phase component activity</i>	90
<i>Factors affecting the temperature gradient</i>	90
Modelling of liquid-phase reduction – summary and conclusions	92
11. On Phase Separation in Lead/Slag Systems	95
Sedimentation	96
Density	97
Droplet size	97
Viscosity	98
Interfacial tension and coalescence	99
System factors	100
Phase separation of two liquids in the presence of a solid phase	104
Expanded settling capacity?	105
12. References	107
